

Repomodore - Product Requirements Document

Version 1.0 | 29 September 2026 | MVP

Product summary

Repomodore is a mobile-first, cross-platform study timer that helps desk-bound students alternate focused work with movement. Its brand promise is **Focus. Rep. Repeat.** Users can run a plain Study timer or a Study + Squats cycle on iOS, Android, and web. The app works without an account and stores data locally by default. A user may opt into Clerk sign-in and Turso-backed sync.

Audience and problem

Primary users are students, programmers, and other people who spend long periods seated. They want one calm timer that supports studying and prompts a brief movement break without managing two competing reminders. The app records self-reported reps; it does not verify exercise or offer medical coaching.

MVP goals and success measures

- Start either timer in at most two actions from the main screen.
- Complete the full 45-minute study -> 5-minute movement break -> next study cycle with clear controls.
- Let anonymous users retain history on the same device and let signed-in users explicitly enable sync.
- Measure activation (first started session), completed focus blocks, movement-break completion versus skip, and 7-day return. No fixed numeric targets until baseline testing.

Modes and core flow

Mode	Default	Behavior
Study	45 minutes, configurable 1-180	One focus countdown; finish, pause, resume, reset; no required movement phase.
Study + Squats	45-minute focus, 5-minute movement break, 10 squats; all configurable	At focus completion start the 5-minute break and prompt 10 squats. User taps Done or Skip; break continues until elapsed or End break. Then next focus is ready.

The movement break is **the rest period**, not an extra five minutes after squats. Reps are optional and self-reported. Users may choose a different movement or a rest-only break when squats are unsuitable. Default loop waits for a deliberate Start at the next focus session; no automatic surprise timer.

Core screens

1. Timer: thumb-friendly mode switch, large countdown/progress ring, Start/Pause/Resume/Reset, next phase, today's focus minutes and reps. This is the mobile home screen.
2. Movement break: visible 5-minute countdown, 10-rep goal, Done, Skip, and End break. Completion can be marked at any point in the break; it never blocks the countdown.
3. History: daily focus minutes, completed blocks, reported reps, and skipped movement breaks; simple 7-day list.

4. Settings: durations, rep goal, sound and notification preferences, local-only or sync selection, export, clear data, and sign-in/out.
5. Account and sync: Clerk sign-in appears only when the user selects sync. Clearly explain what sync stores and provide a cancel option.

Data and account choice

Local-only is the default and fully usable offline. Mobile apps use device-local persistent storage; web uses IndexedDB. Clerk is optional. Selecting Sync asks for sign-in, then explicit confirmation before existing local history is uploaded to Turso. Declining leaves local data intact. Signed-in users can still choose local-only. Switching sync off stops future remote writes and retains the local copy; separately offer deletion of remote data. Show sync status and retry failed operations when connected. Local export uses JSON. No exercise video, body metrics, or health profile in MVP.

MVP scope and exclusions

In scope: iOS and Android apps as the primary experience, a responsive web app with the same core flow, both modes, configurable durations and rep target, local persistence per platform, optional Clerk login plus Turso sync, history, accessible prompts, and platform-supported notifications. Out of scope: social accounts, leaderboards, AI coach, camera rep counting, automatic exercise detection, subscriptions, or medical claims.

Release criteria

- A new user can finish each mode without login on iOS, Android, and web; mobile runs offline after installation and web runs offline after initial load.
- Changing tabs, sleeping the device, or refreshing preserves a running timer accurately from persisted timestamps.
- Done records only the selected rep goal once; Skip records zero reps; reset never counts an unfinished focus block.
- First-time sync uploads local records without duplication and restores them on a second device.
- Disabling sync, sign-out, export, remote deletion, and local deletion behave as described in the UI.
- VoiceOver, TalkBack, and keyboard/screen-reader users can operate every timer action; mobile layout has no horizontal overflow and primary controls are reachable by thumb.

Open implementation decisions

Confirm whether a completed focus block should count when the user ends early; MVP assumes no. Confirm whether the custom movement label is needed in the first build; MVP supports Squats, Other movement, and Rest only as plain labels.
